need help creating a new project for a product, review what i have so far and redteam it in order to provide an updated prd.md and project overview and roadmap so I can use that for a agentic workflow to automate the implementation of the PRD, review existing chat, log and then request any follow up questions or clarifying questions to make the best PRD and system prompts

can you combine the contents of the chat logs from these chats I did in the past, I want to make for a new ai first ai native project called united the people to live at [unitingthepeople.org](https://unitingthepeople.org), this project is focused on creating a network focused on uniting the people around the world with a consolidation on important issues accross the globe, it will also be using api's and or webscraping to consolidate all local, state and national ongoinis in the public and political and geo political arena - think user friendly ai version site like <https://www.congress.gov/> and <http://www.leginfo.ca.gov/> for all juristifications around the world (starting with the USA and IRAN and othe reigons around the world where people need a source of truth and ability to participate and be educatded on the way to unite), facebook groups ( but with a focus on helping unite people and provide them with the ongoinis of government, law, polices). This company will be a non profit that will manage a new blockchain project which will act as a layer 2 on the bitcoin blockchain and will have a dao framework structure like aragon on ether. Lets review the previous chats to get a better idea on how to create a master prompt for scafoldding and impelmenting the project PRD and product priorities / use cases / etc.

Notes

— The narrative- dashboard for all media coverage and social media discussions and topics

- the project will be a non profit organization but will create and manage a global layer 2 quantum resistant implementation of a DAO similar to AI version of Argon on ether
- the L2 blockchain will be an eco system with a stable coin backed by bitcoin and voting

A is better

B is better
